Case Study. National Grid: Continuous monitoring of emissions

Best Practice: Equipment Leaks; Continual Improvement

The Issue

- Compressor station leaks covered by periodic LDAR, meaning small leaks may last long time (until the next LDAR)
- Develop cost-effective method to monitor and quantify fugitive emissions

The Approach

- Install multiplexed, highly accurate and sensitive gas analyser at several locations on boundary fence of compressor station.
- Combine with wind speed, direction and temperature data to identify location and determine emission rate
Case Study. National Grid: Continuous monitoring of emissions

Best Practice: Equipment Leaks; Continual Improvement

The Result

• Two outputs – probability map showing where emissions originate from and emission rate quantification.
• The system monitors continuously providing updated emission rates and leak detection once an hour.
• Uncertainty reduced to ~25%
• Being rolled out across more assets
